Creating String

```
public class A_CreatingStrings
{
   public static void main(String args[])
        {
         String greet ="hello";

         String name = new String("John");

         System.out.println(greet);
         System.out.println(name);

         //Difference
         String message1 = "Hi";
         String message2 = "Hi";

         System.out.println(message1==message2);

         String country1 = new String("India");
         String country2 = new String("US");

         System.out.println(country1==country2);

    }
}
```

Why String is Immutable

```
package com.cwt.string;
```

```
public class B_Immutable
{
    public static void main(String args[])
        {
          String greet = "hello";
          greet.concat("all");
          System.out.println("Before assigning greet variable");
          System.out.println(greet);

          greet = greet.concat(" all");
          System.out.println("After assigning greet variable");
          System.out.println(greet);

        }
}
```
