Recap

User Clicks Button (Front End)

↓

Request Goes to Back End

↓

Back End Talks to Database (sends query)

↓

Database Sends Data to Back End

↓

Back End Sends Data to Front End

↓

User Sees Result on Screen

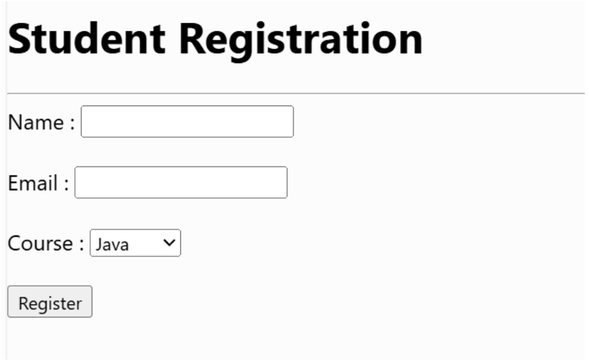

Front End Code

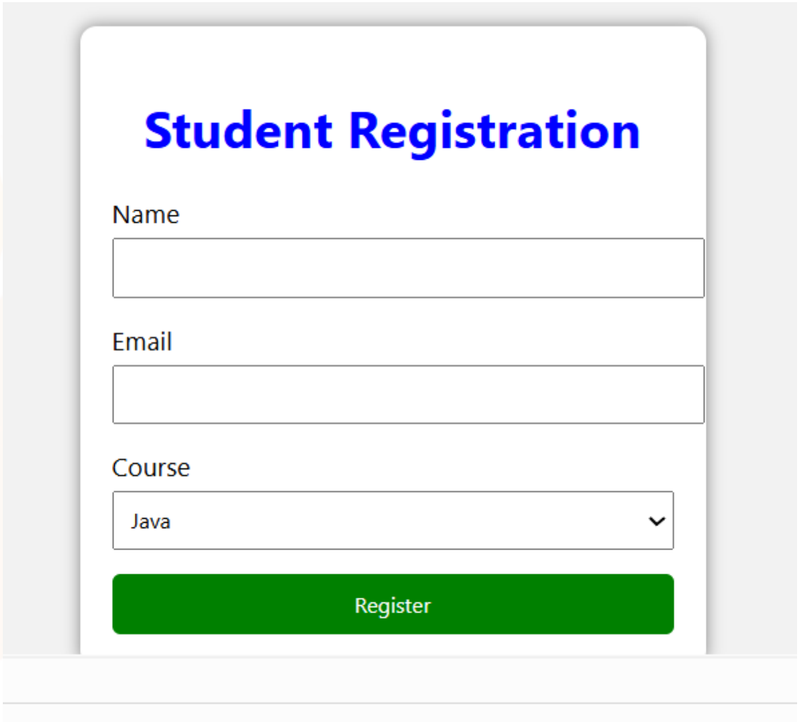

Design related code

Code to send request to back end

Code to create Responsive app

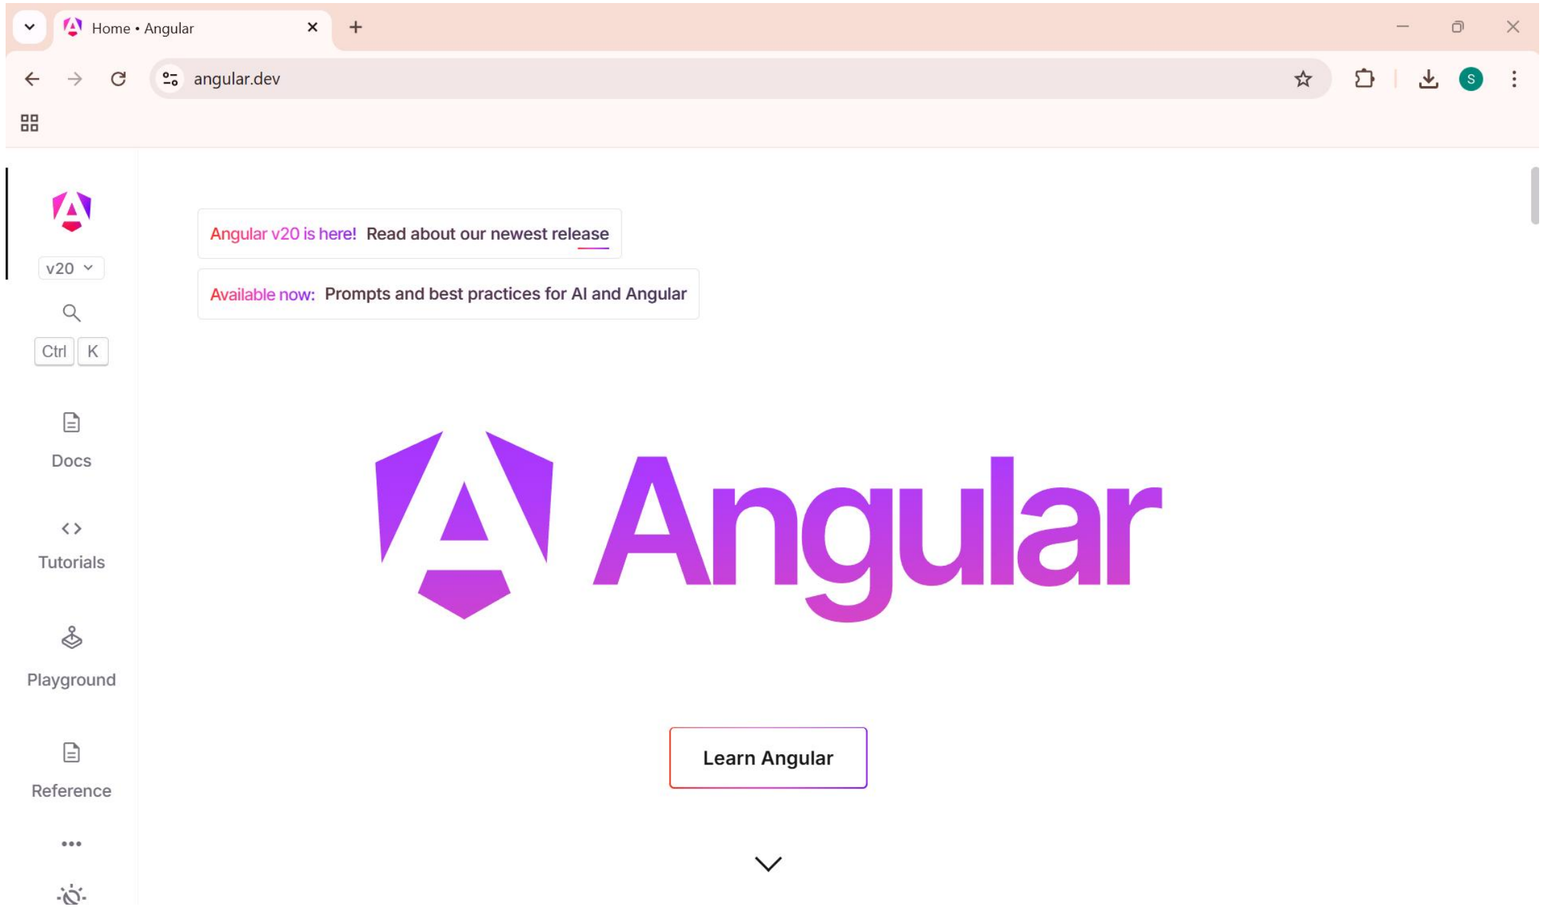

Frontend technologies

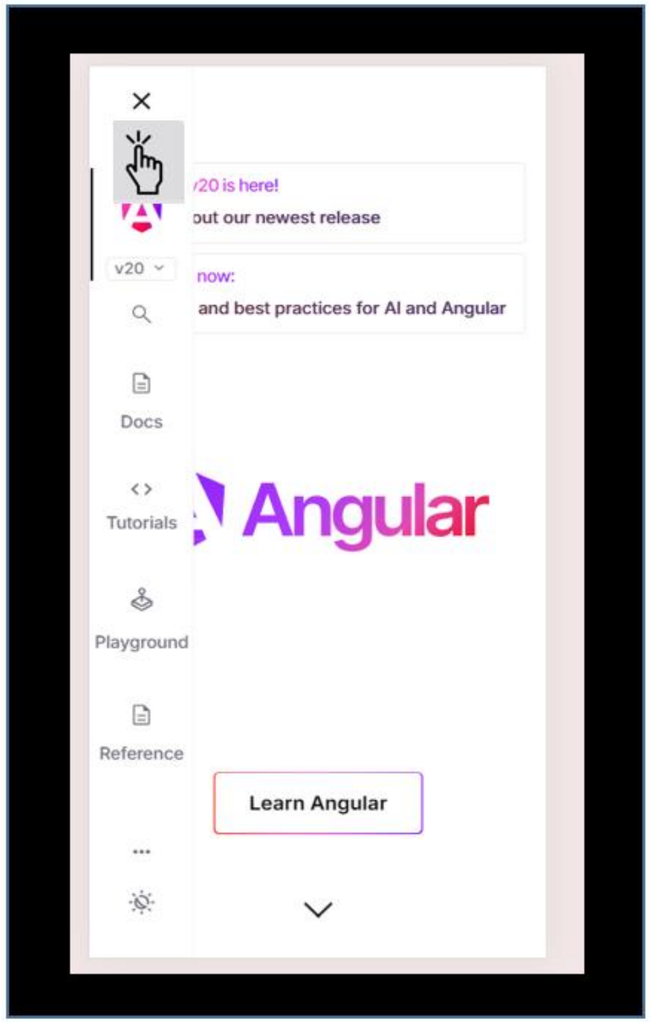

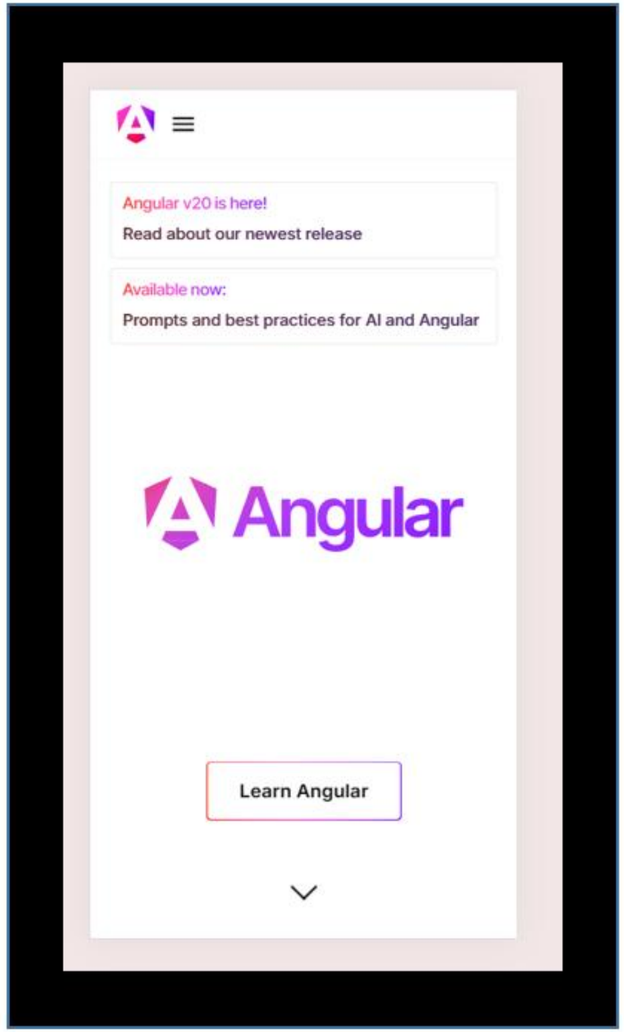

Same application in different devices

Frontend technologies

HTML

CSS

Bootstrap

JavaScript

TypeScript

Angular

Back End Code

Business logic - based on the project requirement

Code to fetch the data from db

BackEnd technologies

Core java

Advanced Java - web application

Hibernate

Spring

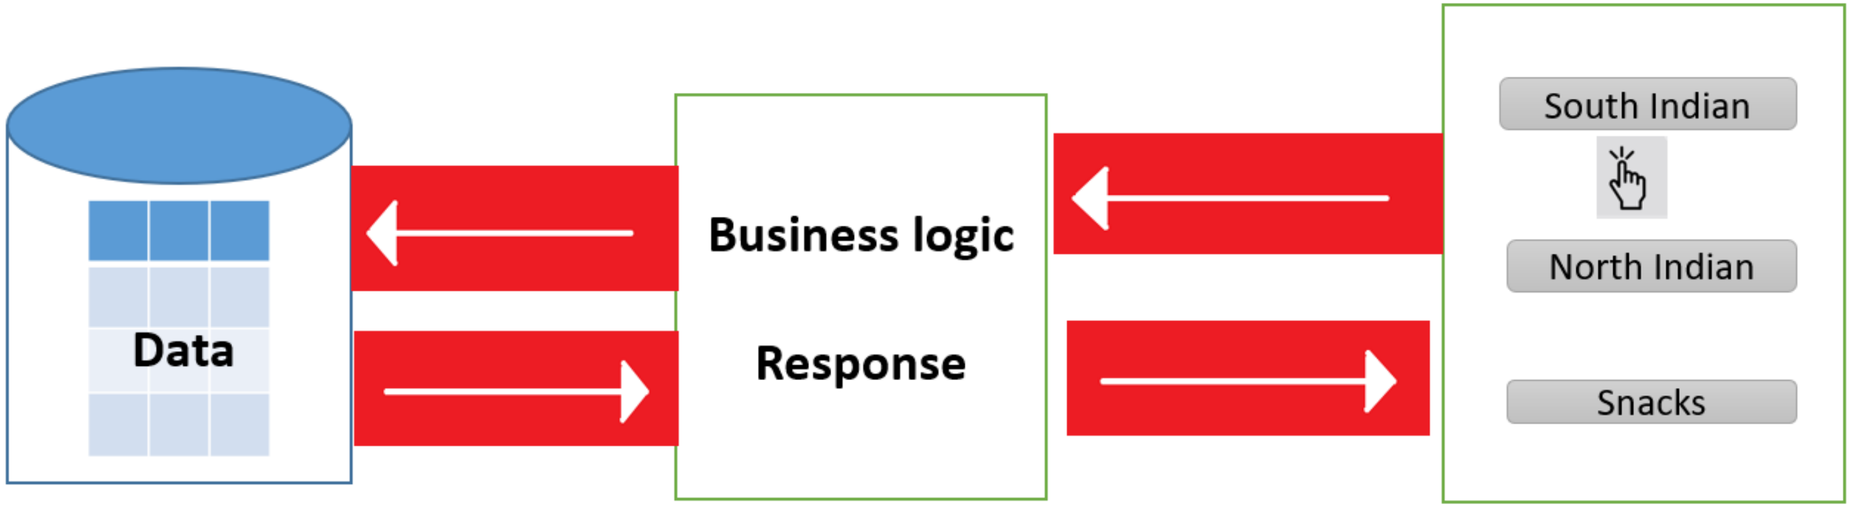

Spring Boot

session.save(student);
session.save(student);

Name : Priya
Age : 22
City : Chennai

String sql = "INSERT INTO student(name, age, city) VALUES (?, ?, ?)";

Hibernate
session.save(student);
Hibernate automatically generates the SQL query and saves the data in the database.

Snacks

Database

MySQL

To store the application data

Roles

Frontend developer
Backend developer
Full stack developer
Testing
SQL Developer, Data Analyst
DevOps Engineer
etc...

Full Stack : Front End + Back End +Database

Front End - client side / user side

user interaction - Form,image, button,etc…

Runs in Browser / mobile app

Database - Tables

Stores and manages application data

Responds to requests from the backend.

Back End - server side :

- **Handles the request from front end.**
- **How application should work- Business logic**
- **Prepares the output based on the requirement.**
- **Interacts with the Database**
- **Runs on a Server**

THANK YOU
